

Liane Allen

Web Coordinator, Center for Systems Biology, Harvard Medical School

Liane began her career doing software testing and technical writing in the machine vision and medical device industries. When the first Netscape Navigator browser was released, she jumped into the world of web development, and from there moved into web software engineering management. After a not-so-brief hiatus to homeschool two kids to college, she took a boot camp to learn how the tech scene had changed in the intervening decade, then jumped back into the tech world. Unfortunately, she had to leave Newbury to do so, because the lack of high-speed internet made it impractical to work for a Boston-area employer from home, despite a job that allows it. Due to this experience, she has a strong interest in helping Newbury build the internet infrastructure that can support well-paid high-tech jobs. She looks forward to moving back to Newbury in the future.
